## 1 Drawing on top of an image

The question "Drawing on an image with TikZ" asks for a method to draw on top of an image file (included by \includegraphics) with TikZ. The basic solution to this problem is to include the image in a node inside the tikzpicture environment and add TikZ \draw commands as one normally would. To make this process easy it is useful to set the coordinate system relative to the size of the picture, so that the draw graphics are scaled whenever the image is scaled.

tikzonimage (env.)

The tikzonimage environment is used to include an image file and then use TikZ to draw on top of it. It starts a new tikzpicture environment and sets the coordinate system so that the origin is at the lower left corner of the image. By default it also scales the coordinate system so that the point (1,1) is at the upper right corner of the image.

```
\begin{tikzonimage} [\langle image \ options \rangle] {\langle image \ file \rangle} [\langle TikZ \ options \rangle]
```

The contents of the first optional argument are are passed to \includegraphics, the second optional argument works in exactly the same way as the optional argument of the tikzpicture environment. For example, in order to draw a small red circle in the middle of some\_image.jpg, one could write

```
\begin{tikzonimage}[width=0.3\textwidth]{some_image.jpg}[color=red]
  \fill (0.5,0.5) circle [radius=2pt];
\end{tikzonimage}
```

Note that the radius has to be given with an absolute unit, so that the circle does not get squeezed into an ellipse if some\_image.jpg is not square.

tsx/scale cs

The coordinate system scaling behaviour can be modified with the tsx/scale cs option. Its default value is both, resulting in the behaviour described above. If the option is set to x, then the coordinate system as set so that (1,0) is at the lower right corner of the image and the rectangle with vertices (0,0), (0,1), (1,1) and (1,0) is a square. This is demonstrated in Figure ??. Setting tsx/scale cs=y works analogously. If no scaling is desired at all, it can be disabled by setting the option to none.

tsx/show help lines

For easier placement of graphics on top of the image, it is often desirable to display a grid of lines on top of it during the development process. This can be achieved with the tsx/show help lines option, which causes the package to display a grid with coordinate labels on top of the image. An example is shown in Figure ??. The option takes an argument to specify how many lines are shown

<sup>\*</sup>This document corresponds to onimage v0.3, dated 2011/07/05.

Figure 1: The tsx/scale cs=x option.

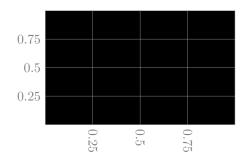

Figure 2: The tsx/show help lines option.

(technically this is not quite true: the number displayed of lines is one higher; for example, Figure ?? is created with tsx/show help lines=4). The default value is 10. If the argument is not an integer, then it is interpreted as a dimension specifying the distance between the lines.

 $\mathtt{tikzonnode}\ (\mathit{env.})$ 

Sometimes one would like to include several images into a tikzpicture and still have the rescaled coordinate system for each of them. For this reason this package also provides an environment to change the coordinate system so that it matches an arbitrary node.

The tikzonnode environment acts like a scope so that, for example, it limits clipping. To draw a red circle in the middle of a node with some text, one could write

```
\begin{tikzpicture}
   \node (A) [text width=2cm] {abc abc abc abc abc abc abc abc};
   \begin{tikzonnode}{A}[color=red]
     \fill (0.5,0.5) circle [radius=2pt];
   \end{tikzonnode}
\end{tikzpicture}
```

The environment respects the tsx/scale cs and tsx/show help lines options.

## 2 Implementation

```
1 \RequirePackage{tikz}
                  2 \RequirePackage{xstring}
                 These options control the scaling of the coordinate system in the tikzonnode
                 environment.
                  4 \newif\iftsx@scalecs@x
                  5 \newif\iftsx@scalecs@y
                  6 \tikzset{
                        tsx/scale cs/.is choice,
                        tsx/scale cs/x/.code={\tsx@scalecs@xtrue\tsx@scalecs@yfalse},
                        tsx/scale cs/y/.code={\tsx@scalecs@xfalse\tsx@scalecs@ytrue},
                        tsx/scale cs/both/.code={\tsx@scalecs@xtrue\tsx@scalecs@ytrue},
                        tsx/scale cs/none/.code={\tsx@scalecs@xfalse\tsx@scalecs@yfalse},
                 12
                        tsx/scale cs=both
                 13 }
                 14
                 The next option controls the display of the help lines. By default they are disabled.
                 15 \tikzset{
                        tsx/show help lines/.initial=0,
                 16
                 17
                        tsx/show help lines/.default=10
                 18 }
tikzonnode (env.) The implementation is pretty straightforward. tikzonnode simply creates a scope
                 with the options for the coordinate system shift and passes the optional argument.
                 19 \def\tikzonnode#1{%
                 20
                        \pgfutil@ifnextchar[{\tikzonnode@opt#1}{\tikzonnode@opt#1[]}%
                 21 }
